                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  B41182
collagen alpha 1(II) chain precursor (long splice form) - mouse
cylagen alpha 1(II) chain precursor (long splice form) - mouse
Cyspecies: Mus musculus (house mouse)
Cyspecies: May-1992 #sequence_revision 28-May-1992 #text_change 16-Jul-1999
Cyaccession: B41182

Collegen alpha 1(II) chain precursor - bovine (tentative sequence) (fragments)

Cyspecies: Bos prindgenius taurus (cattle)

Cyspecies: Bos prindgenius taurus (cattle)

Cybate: 24-Apr-1984 #sequence revision 17-May-1996 #text change 31-Mar-2000

Cyaccession: A90369; A90396; A9210; S03940; A90189; A05039; A02859

Example: E.J.; Lunde, L. G.

Biochemistry 12, 3153-3159, 1973

AyTitle: Isolation and characterization of the cyanogen bromide peptides from the alphalmaterine number: A90369; Muld: 73258693; PMID: 4732855

AyContents: composition of CNBr1 and CNBr4

C;Comment: Prollines and lysines at the third position of the tripeptide repeating unit are 5-hydroxylated and subsequently O-glycosylated.
C;Comment: The amino-terminal propeptide domain appears not to be completely cleaved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A;Cross references: GDB:119064; OMIM:120190

C;Complex: type V collagen may be a homotrimer of alpha 1(V) chains (see PIR:CGHUIV), a alpha 2(V) chain and one alpha 3(V) chain, initially linked by disulfide bonds among the ength, is formed with desmosine cross-links made from lysine and allysine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   on the long arm
          2 type V collagen chain.

Nuclect Acids Ress. 17, 6742, 1989
Aritle: Nucleotide and amino acid sequences of the entire human alpha-1 (III) collagen.
Aritle: Nucleotide and amino acid sequences of the entire human alpha-1 (III) collagen.
Aritle: Nucleotide and amino acid sequences of the entire human alpha-1 (III) collagen.
Aritle: Oxforder and amino acid sequences of the entire human alpha-1 (III) collagen.
Aritle: Cordance type: mRNA
Arcessions: EMB:XL5332, NUD:292545; PIDM:CAA3387.1; PDD:9930045
Aritle: Cordance: EMB:XL5332, NUD:292545; PIDM:CAA3387.1; PDD:9930045
Aritle: Cordance: EMB:XL5332, NUD:292645; PIDM:CAA3387.1; PDD:9930045
Aritle: Cordance try 16, 1158-1164, 1977
Aritle: Cordance or Aritle: Cordance of collagen: amino acid sequence of cyanogen bromide peptide
Aritle: Cordance try 16, 1158-1164, 1977
Aritle: Cordance or Aritle: Aritle: Aritle: Aritle: Aritle: Aritle: Cordance or Aritle: Ari
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   규
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COL3

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                              US-10-658-989A-1

Patent No. 6323314

GENERAL INFORMATION:
APPLICANT: Ovist, Per
APPLICANT: Bonde, Martin
ITILE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out the
TITLE OF INVENTION: Method and use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:

## ALIGNMENTS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The patent discloses recombinant human gelatin which is useful in various compositions including binding agents, encapsulants, stabilishing agents, film-forming agents, moisturising agents, emulsifiers, thickening agents, gelling agents, colloidal agents, moisturising agents, pharmaceutical compositions, hard gel capsules, soft gel capsules, pharmaceutical capsules, soft gel capsules, plasma expander, colloidal volume replacement materials, graft coatings, medical sponges, medical plugs, pharmaceutical stabilisers, micro-carriers, edible compositions, protein supplements, fat substitutes, nutritional supplements, fat substitutes, nutritional compositions, industrial composition, call culture compositions and compositions for use in the laboratory. Pharmaceutical compositions and compositions for use in the laboratory. Pharmaceutical compositions and compositions accombant gelatin are used as vaccines. They are also used to treat various joint conditions such as arthritis, athrosis and other flexibility. Recombinant gelatin is also used in food and beverage industries. The present sequence is human alphal (1) type I collagen helical domain (residues 179-679). This sequence is a recombinant gelatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       339
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                            The invention describes a vaccine composition comprising a recombinant gelatin, and an antigenic agent. The vaccine can be delivered by infection, through masal, oral, transdermal or mucosal routes, or through delivery. Administration may also be oral, rectal, transmucosal, intestinal, or parenteral (e.g. intraneuricular, intravence subcuraneous, intranedullary, intraocentacini, intravencini, intravence intraperationeal, intranagal or intraocenta intravence (small composition is formulated for the prevention of vaccinia virue (small pox), polio virue (salk and Sabin), mumps, meaales, rubella, diphtheria, tetanus, Varicella-Zoster (chicken pox/shingles), pertussis (whopping cough), Bacille Calmette-Guerin (BCG, tuberculosis), Haemophilus influenzae meniggitis, rabies, cholera, dapanese encephalitis virus, cough), Shigella hepatitis A, hepatitis B, adenovirus, yellow fever, foot and mouth disease, hepres simplex virus, respiratory syncytial virus, rotavirus, dengue, Mest Nile virus, Turkey herpes virus (Marek's disease), influenza, and anthrax. This is the amino acid sequence of a recombinant gelatin used in the creation of a vaccine composition of the invention.
                                                                                                                                                                                            New vaccine composition comprising a recombinant gelatin and an antigenic agent, useful for preventing e.g. polio virus, mumps, measles, rubella, diphtheria, tetanus, chicken pox/shingles, pertussis, cholera, rotavirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             340 GPKGSPGEAGRPGEAGLPGAKGLIGSPGSPGPDGKTGPPGPAGQDGRPGPPGPRGARGQA 399

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline and 3-hydroxyproline and a lincorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proteins. The method is also useful in studying the structure and function of protein. The present sequence represents a human collagen! (alphal) protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins the sespecially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proteins depends which do not normally contain trans-4-hydroxyproline. The present sequence represents human collagen 1 (alphal) helical region, which may be produced using the method of the invention
                                                                                                                                          Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants
                                                                                                    A human collagen 1 (alphal) protein helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 10; Fig 39A-E; 260pp; English.

```
The present sequence represents a human type 1 (alphal) collagen protein. Peptides derived from the protien were used to demonstrate incorporation of 3.4-derydron-large into the peptide, using the method of the invention. The specification describes a method for the incorporation non-natural amino acid into a polypeptide. The method comprises reacting at least one 3.4-derydroproline residue in the polypeptide with an epoxyproline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadnesives), and for incorporating a wice variety of groups, including therapeutic ligands and biological probes,
                                                                                                                                                                                                                                    Alphal collagen; 3,4-dehydro-L-proline; epoxidation; 3,4-epoxyproline; collagen; mussel adhesive protein; bloadhesive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            298 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA

A fusion protein (AAR89472) comprises the alpha-helical region of human collagen I(a) linked to amino acids 46-93 of human mature dermatan sulphate proteoglycan (decorin). It can be expressed in Escherichia colitansformants carrying a vector incorporating a chimeric gene (AAT16518) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinosen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to
                                                                                                                                                                                                                                                                                                                                                             Transforming growth factor; TGF-beta-1; collagen IA; osteogenesis;

The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily dydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codors not preferred by that cell for naturally occurring codors not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated
                                                                                                                                                                              108

method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen 1 (alphal)/decorin protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGARGQA 108

         and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence it that of a human pancreatic protein of the invention.

                                                                                                                                           A fusion protein (AAR89469) comprises the alpha-helical region of human collagen I(a) linked to the human mature bone morphogenic protein 2B (BMP2B). It can be expressed in Escherichia coll transformants carrying vector incorporating a chimeric gene (AAT16515) coding for the fusion. The BMP moiety induces osteogenesis, while the collagen moiety provides an integral substratum or scaffolding for the BMP and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of BMP to a target tissue
                                                                                                                                                                                                                                                                                                                                                                                                  1 GPP-----GEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 48

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxyproline. The method is also useful in studying the structure and function of proteins equence represents a chimaric collagen 1 (alphal)/bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             108
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               416

Chimaeric DNA encoding protein contg. extracellular matrix protein domain - and cellular regulatory factor domain, partic. useful as osteogenic agents, also related vectors, transformed cells and chimaeric proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A fusion protein (AAR89470) comprises the alpha-helical region of human collagen I(a) linked to the human mature transforming growth factor beta-1 (TGF-beta-1). It can be expressed in Escherichia coll transformants carrying a vector incorporating a chimeric gene (AAT16516) coding for the fusion. The TGF-beta- moiety increases efficacy of the body's normal soft tissue repair response and also induces osteogenesis. The collagen moiety provides an integral substratum or scaffolding for the TGF and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of TGF-beta-1 to a target tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               297 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 356

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily droxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4hydroxyproline and 1. Controline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proteins. The method is also useful in studying the structure and function of proteins depends on the post translational hydroxylation of proteins the present sequence represents chimeric collagen i (alphal/transforming growth factor-betal (TGF-betal) protein, which may be produced using the
                                                                                                                                             Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation; ss. transforming growth factor-betal; TGF-betal; chimera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        356

Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer conn-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                            neoplastic pancreatic cell; pancreatic cell; pancreatic cancer; cancer death; cytostatic; vaccine; gene therapy; non-cancerous pancreas disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 97.0%; Score 1149; DB 7; Length 1211; Best Local Similarity 93.6%; Pred. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancercous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         517

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
